Intro to CO₂ Laser Cutting

About this Training

- Quiz questions are embedded within the video
 - You will not be able to skip forward
 - You must score a 100% to pass the training
 - Retake individual questions
 - These slides are available for review on the Makerspace website on the equipment page for the individual CO₂ laser cutters
-

Training Topics

- What can you do and make with laser cutters?
 - Laser Principles and Characterization
 - Laser Cutter Design and Theory of Operation
 - Laser Cutter Operation Workflow
-

MAKE

102

What Can You Make with CO₂ Laser Cutters

MAKE 102

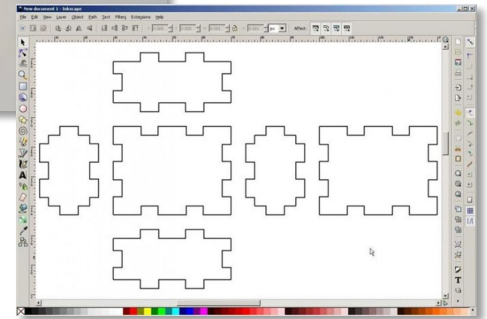

What Can I Do With CO₂ Laser Cutters?

- CO₂ laser cutters and engravers are excellent for making precise 2-dimensional cuts in a variety of materials, as well as engraving
- Engraving is destructive marking of the the surface of the material

**MAKE

Laser Principles and Characterization

What is Laser Light?

Some Laser Specifications

The laser produces a beam with a particular wavelength (frequency), beam diameter, and amplitude

- Sometimes, lasers are referred to by the type of gas used to excite the photons, this essentially specifies the wavelength of the laser light:
 - For example, a CO₂ laser typically generates a wavelength of between 9,300 and 10,600 nm
- Beam diameter is often referred to as spot size
- Amplitude is often specified by the laser power in Watts
- Most cutting lasers do not stay on 100% of the time, **they pulse on and off at a specified frequency and duty cycle**

MAKE 102

Laser safety classes for machines that contain a laser source.

(Not for individual laser sources that are not integrated into a machine.)

Machine Laser Safety Classification

Machine Laser Safety Class	Description
Class 1	The accessible laser radiation of this class is harmless - even with prolonged radiation, or the laser is housed in a radiation-impervious manner.
Class 2	These comprise visible lasers (e.g. laser pointers with an output below 1mW), which are only safe for the eyes with short-term radiation below 0.25 seconds.
Class 3	The accessible laser radiation is in any case dangerous for the eye. Please also pay particular attention to reflections (e.g. by reflective material surfaces).
Class 4	Damages to eyes and skin can be caused or fires can be triggered within the danger zone of the laser. With this laser class, the user is obliged to fully comply with protection provisions and recommended PPE.

MAKE

102

Laser Cutter Design and Theory of Operation

How does a laser cut material?

1. Laser energy is incident on the workpiece material
2. The concentrated energy heats the material
3. The material disintegrates, vaporizes, or melts away

Notice that:

- The heated zone is larger than the beam diameter due to thermal conduction and heat radiation
- There may be some reflected laser energy, this is bad!

MAKE 102

What Determines if Laser Energy is Reflected or Absorbed by the Material?

1. For a given material, the wavelength of the laser determines if the laser beam will be absorbed or reflected
2. This is a function of the material properties
3. This means that a particular type of laser can cut a particular set of materials, and not others

MAKE 102

Non-Usable Materials

Warning !

Processing of the following materials is not permitted:

Carbon, Polyvinyl chloride PVC, Polyvinyl butyral PVB, Polytetrafluorethylene PTFE (Teflon), carbon fiber, beryllium oxide and materials containing halogen (fluorine, chlo-rine, bromine, iodine and astatine), epoxy- or phenolic resins

Take care when processing the following materials:

Manganese, chromium, nickel, cobalt, yttrium and lead. Material with the naming addition "flame-retarding" since it might contain bromine.

Notice

Any material not listed above may only be processed with written approval of Trotec.

We recommend to run a material processing test with the above mentioned mate-rial using the appropriate

Trotec assumes no responsibility for any consequences of laser processing in any application such as medical or pharmaceutical applications.

NO METALS can be cut on the CO₂ laser cutters!

MAKE 102

What happens to the material that is cut?

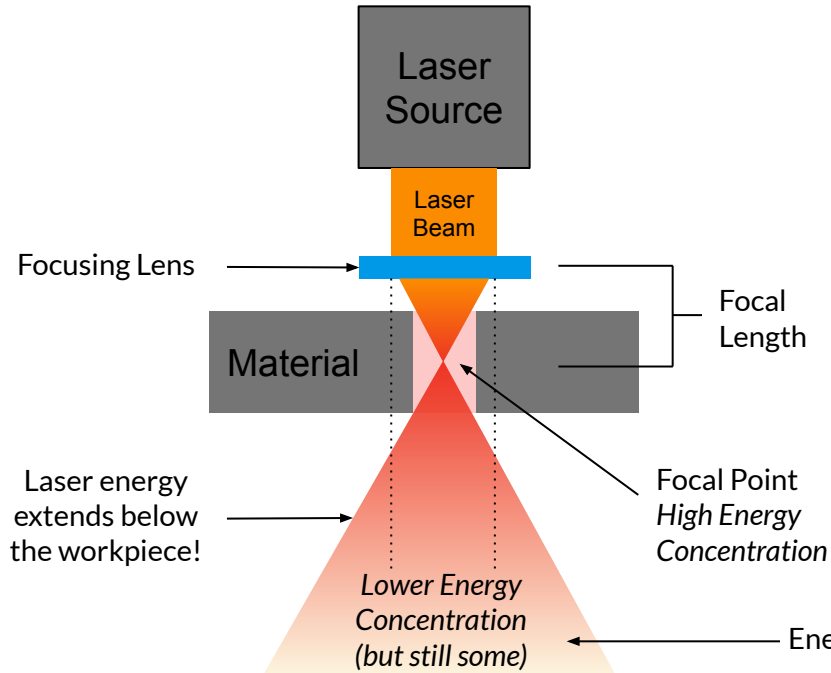

1. The material disintegrates, vaporizes, or melts away. It is usually dispersed into the atmosphere in the process chamber inside the machine.
2. Laser cutters have exhaust systems to pull away vaporized material.
3. If you can smell the cut material while cutting, you are inhaling the vaporized material and this can be hazardous.
4. Verify that exhaust systems are functioning properly while cutting and do not cut hazardous materials.

Laser Power and Energy Concentration

1. Most laser cutting systems do not have enough power to operate as shown to the left.
 2. The energy concentration is not high enough to heat the material enough to cut it.
 3. To cut effectively, the system will need a high laser power or higher energy concentration.
-

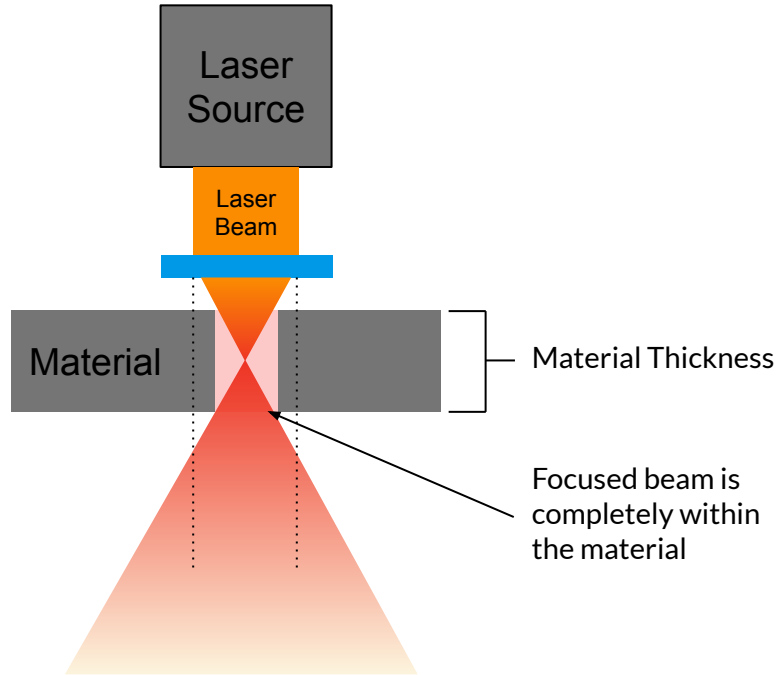

Increasing Laser Cutter Energy Concentration

- A lens is used to focus the energy onto a convergence point. This is called the **focal point**.
- The linear distance between the lens and the focal point is called the **focal length**.
 - a. Laser energy is **more** concentrated closer to the focal point
 - b. Laser energy is **less** concentrated further from the focal point
- For a cut to succeed, the laser energy must have a high enough concentration within the entire material.
 - a. If the energy concentration is too low, the laser **will not cut the material**, even with repeated cutting passes.

MAKE 102

For a Successful Cut

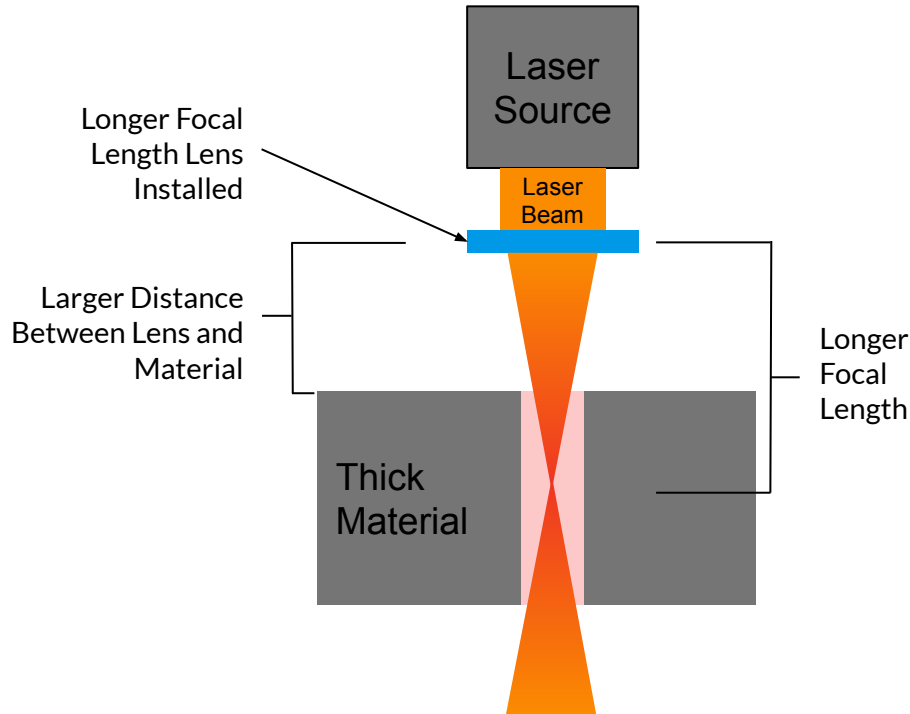

Problems with Thicker Material

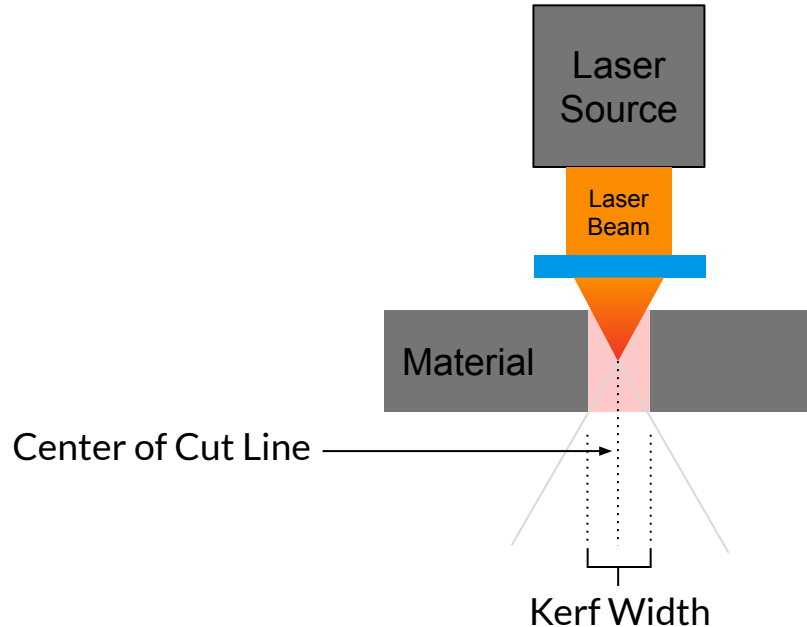

MAKE 102

Thicker Material = Longer Focal Length

- Many cutting lasers have interchangeable focusing lenses that are used when cutting material of different thicknesses.
- In general
 - Thinner Material -> shorter lens
 - Thicker Material -> longer lens
- Speedy100 - Has a fixed 1.5" lens
- Speedy400 - Has interchangeable lenses
 - If you have thick material to cut, over 0.5" thickness, use the Speedy400 and ask the staff to help install a long focal length lens

Laser Kerf Width

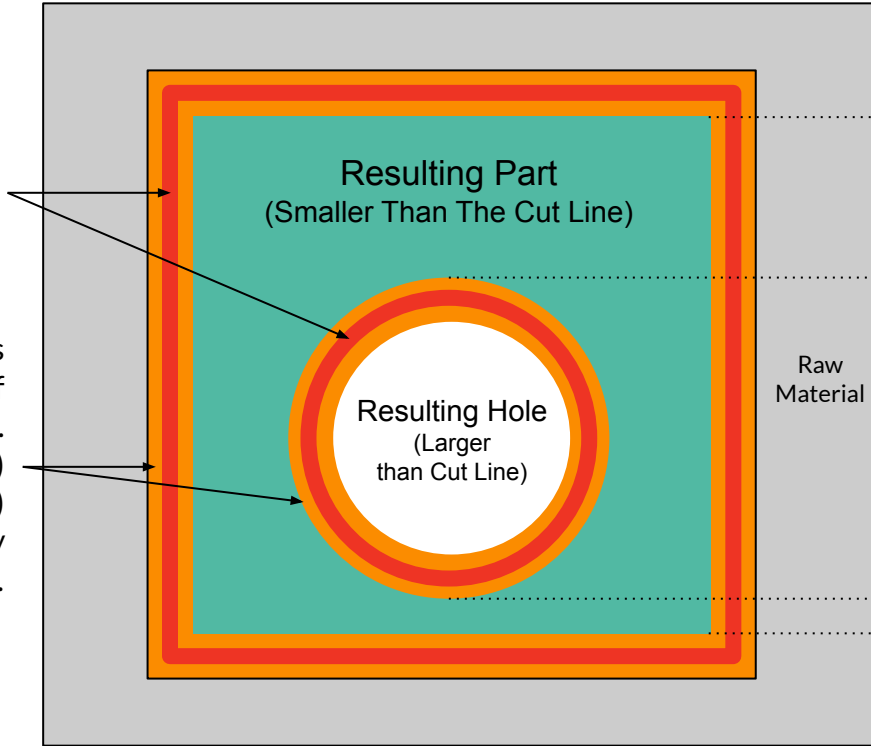

- When cutting, most lasers follow the center of the designed path.
- The laser will cut a path through the material with a width, referred to as the **kerf width**.
 - When cutting the outside of a feature, the resulting feature will be slightly smaller than design specifies
 - When cutting the inside a feature, the resulting feature will be slightly larger than design specifies
- Kerf width will vary from material to material, by laser settings, lens selection, and slightly from machine to machine.
- If your parts require high precision, cut a test piece and measure the kerf with a caliper.

**MAKE
102**

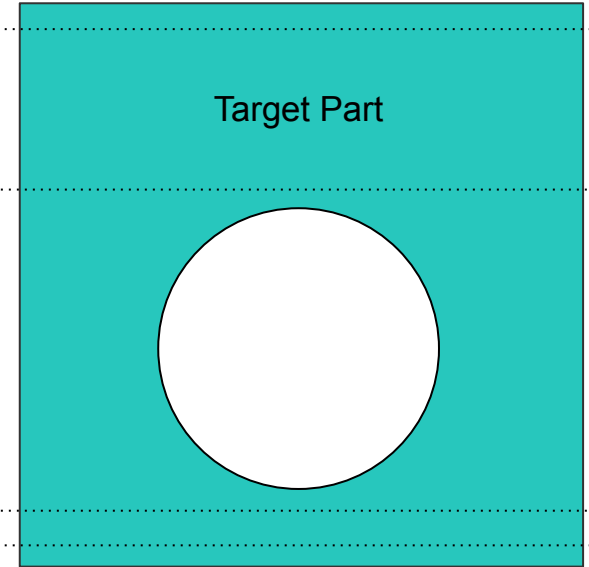

Laser Kerf Example - Top Down View

The laser cuts along
the **red** path

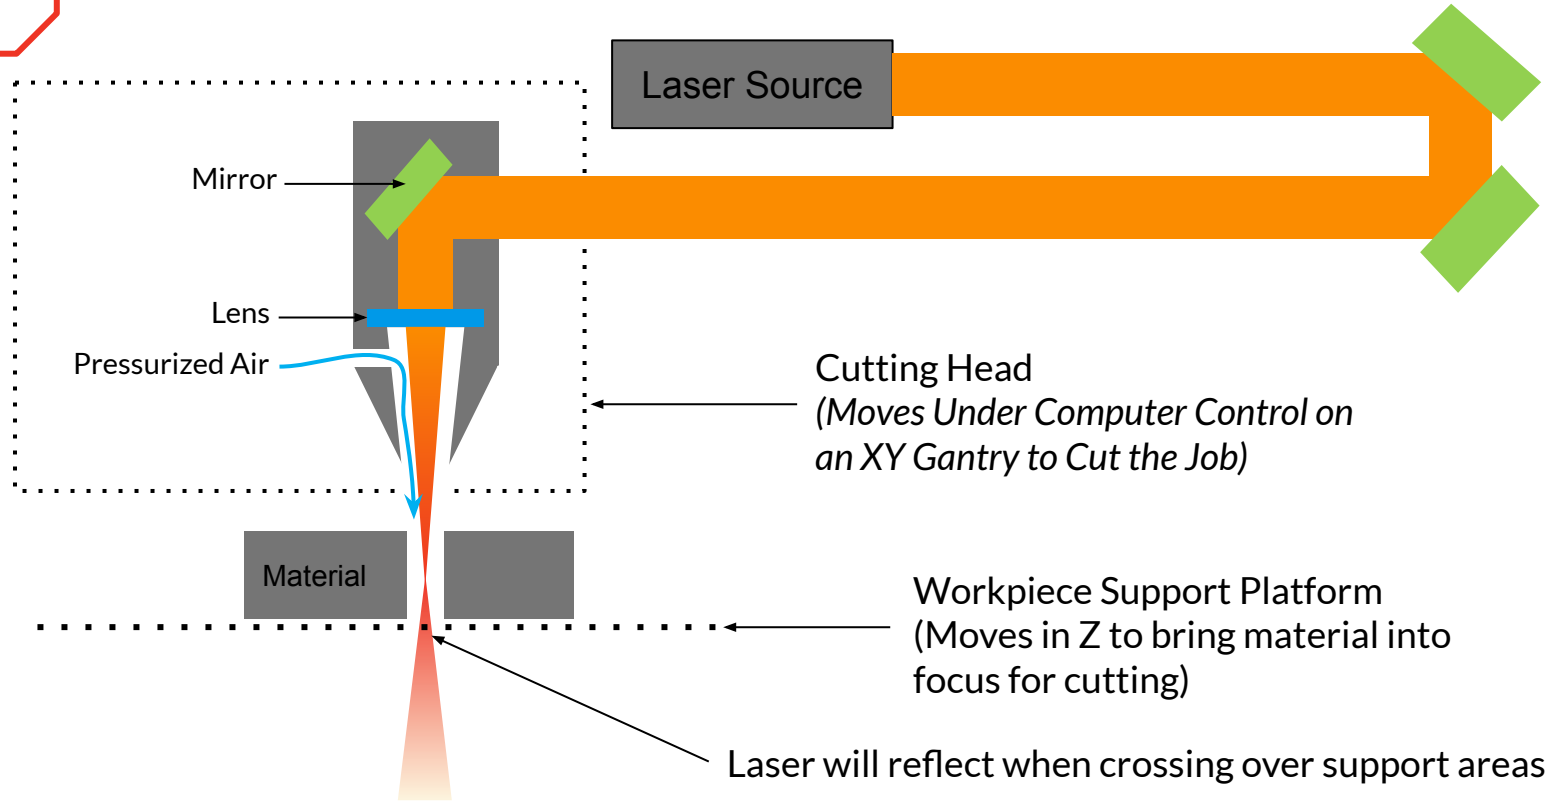

The laser also removes
material on both sides of
the cut line.
(Orange Material)
(Exaggerated for Example)
*Usually this is a few
thousandths of an inch.*

Laser Cutter Operation Workflow

Laser Cutter Operation Workflow

1. 2D File Design or Acquisition
 - Files can be designed in any CAD or vector design software or can be downloaded from project websites
 2. File Preparation for Laser Cutting
 - Files are modified using Adobe Illustrator or CorelDraw to indicate which lines are cut lines, engrave lines, etc...
 3. Specify the Cut Parameters for the Machine and Material
 - Done in print dialog and preferences page
 4. Verify Setup is Appropriate and Setup the Machine
 - Material Type
 - Lens
 - Focus
 - Job start location
 5. Cut the Job and Wait for it to Finish
 6. Clean Up
-

MAKE 102

1 - 2D Vector File

2 - File Prep

3 - Cut Parameters

4 - Machine Setup

5 - Cut

6 - Cleanup

Step 1: 2D File Design or Acquisition

- Laser cutters are controlled from a 2D design file, often called a vector file. 2D files are flat line drawings in a single plane.
 - There are many ways to make 2D design files, some available software packages are:
 - Solid Works
 - Fusion360
 - CorelDRAW
 - Adobe Illustrator
 - Or, download existing 2D files from websites like:
 - Make, GrabCad, Thingaverse, Pinterest, etc...
 - Common 2D file formats:
 - .dxf .ai .pdf .svg
-

MAKE 102

1 - 2D Vector File
2 - **File Prep**
3 - Cut Parameters
4 - Machine Setup
5 - Cut
6 - Cleanup

Step 2: File Preparation for Laser Cutting

- Since laser cutters can engrave, mark, and cut material, the design file must specify which lines are to be engraved and which lines are to be cut.
 - Laser software uses line color and line width to distinguish between engrave lines and cut lines
 - To indicate to the laser how to treat a particular line, there are specific line widths and line colors that must be applied
 - In general:
 - **Red** lines with minimum thickness are cut lines
 - **Black** lines are engrave lines
-

MAKE 102

1 - 2D Vector File
2 - File Prep
3 - Cut Parameters
4 - Machine Setup
5 - Cut
6 - Cleanup

Step 2: Notes on Color Representation

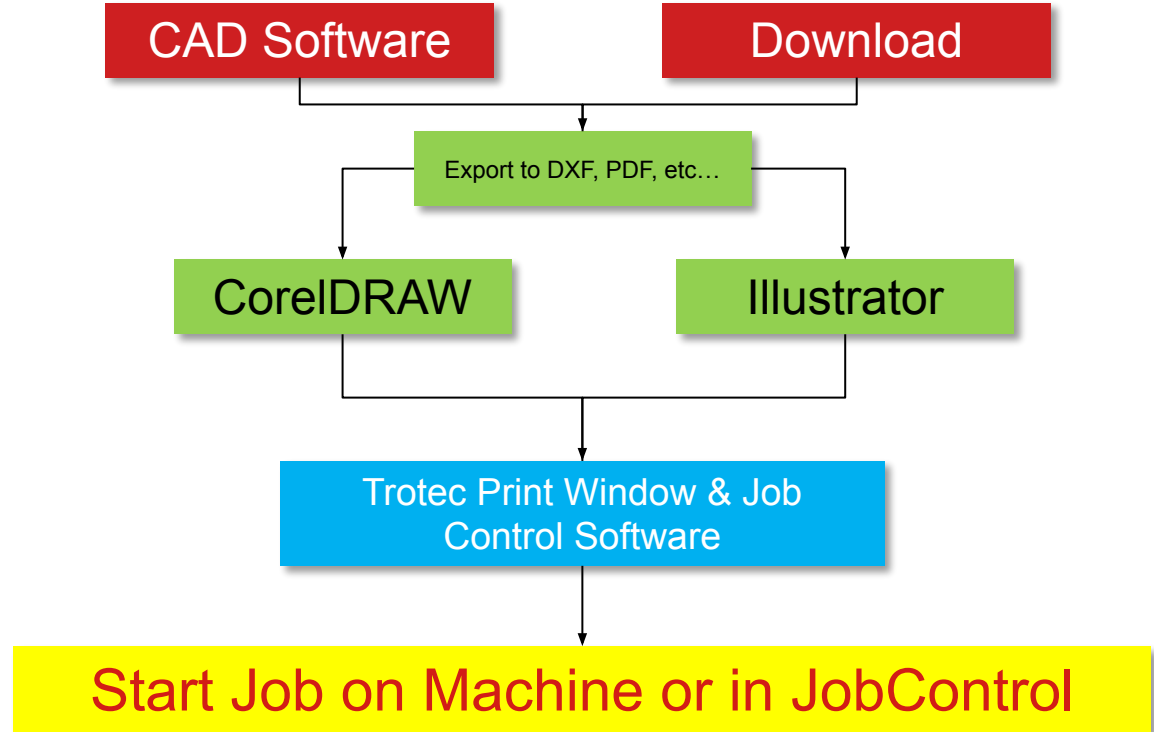

- Colors are represented with RGB color values
- Each color is represented using 3 numbers
 - (Red Value, Green Value, Blue Value)
 - Each number ranges from 0 to 255
 - 0 means none of the color
 - 255 means 100% of the color

- (255,128,0) 100% Red 50% Green 0% Blue -> Orange
 - (0,0,0) 0% Red 0% Green 0% Blue -> Black
 - (0,0,255) 0% Red 0% Green 100% Blue -> Blue
 - (0,255,0) 0% Red 100% Green 0% Blue -> Green
 - (255,0,0) 100% Red 0% Green 0% Blue -> Red
-

What are CorelDRAW and Adobe Illustrator?

CorelDRAW[®]
GRAPHICS SUITE

- CorelDRAW and Adobe Illustrator are vector based design softwares
 - Use them to scale, colorize, and position designs to be cut and engraved
 - Set line colors and widths to specify if they are cut or engrave lines
-

Small Fires When Cutting

Small fire that
follows the laser

- You may notice small fires or flashes on the workpiece as the laser cuts or engraves.
- This is ok as long as the fire is small and is following the laser.
- If you notice a large and consistent fire while cutting, immediately stop the job using the stop button on the laser and extinguish the fire with the water bottle (fire extinguisher if water bottle does not work).
- Check to make sure you are using an approved material and proper settings.
